This will create an enumerable sequence of ints from 0 to 12 inclusive and shuffle it randomly, then returning the first element of the shuffled sequence.

Keep in mind that different methods may have different performance characteristics and should be chosen based on the specific requirements of the application.

which one is best for a gambling roulette app on Unity engine

The best method for generating random numbers in a gambling roulette app on the Unity engine will depend on the specific requirements of the app.

The first method you provided using the `Random` class is a good option as it is simple and easy to understand. It can be used to quickly generate random numbers within a specific range.

The second method I provided, using the modulo operator, is also a good option as it uses the current tick count of the `DateTime` class, which provides a high-resolution time, it can be useful if you want to avoid repeated numbers. However, it may not be as random as the first method.

The third method I provided using `Random.Next(int minValue, int maxValue)` is also a good option as it gives you a number between 0 and 12 inclusive and it also simple and easy to understand.

The fourth method using `Enumerable.Range(int start, int count)` and `Random.Next(int)` is also a good option as it creates an enumerable sequence of ints from 0 to 12 inclusive and shuffle it randomly. It is a good option if you want to avoid repeated numbers.
